```
import java.util.Random;
public class Puzzle5 {
   private static Random rnd = new Random();
    public static void main(String[] args) {
       StringBuffer word = null;
       switch(rnd.nextInt(2)) {
            case 1: word = new StringBuffer('R');
            case 2: word = new StringBuffer('T');
            default: word = new StringBuffer('J');
       word.append("est");
       System.out.println(String.format("It's time for a %s.", word));
```

Ice Breaker Exercise: EIL5 "Programming"

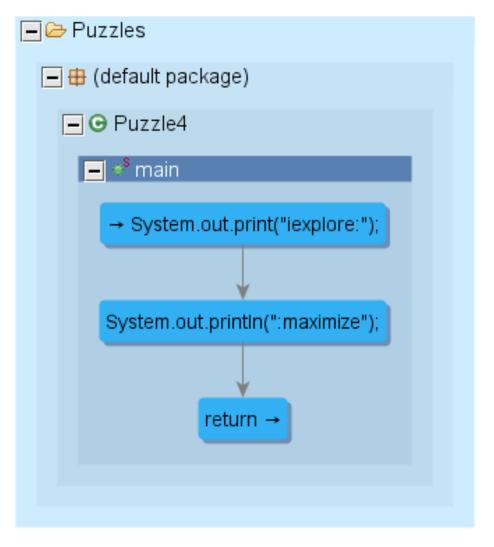

- Explain It Like I'm Five (EIL5): How do computer programs work?
- Can your explanation intuitively address:
 - Complexity of software
 - Programming bugs
 - Security issues

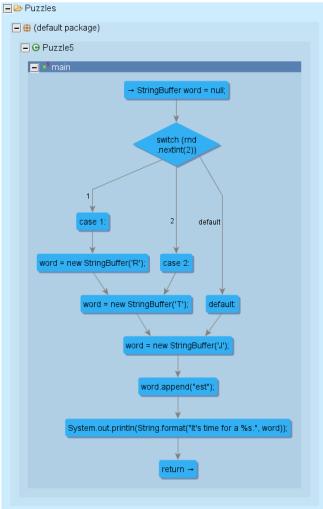

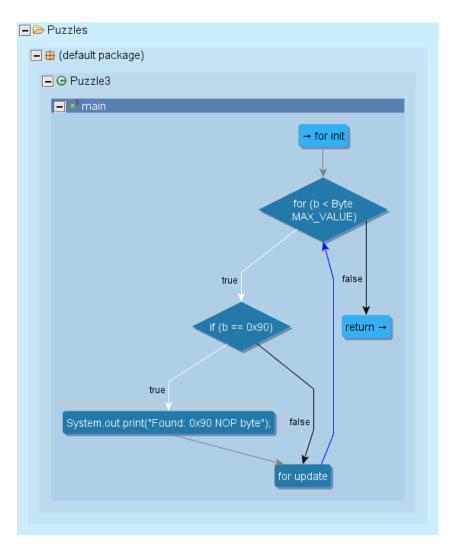

Control Flow Graph (CFG)

- A control flow graph (CFG) is a graph representation that captures the paths that might be traversed through a program during its execution, (i.e. the orderings that the program's statements may be executed in at runtime).
- Reading: Frances E. Allen. 1970. Control flow analysis. In Proceedings of a symposium on Compiler optimization. ACM, New York, NY, USA, 1-19.

Control Flow Graph (CFG)

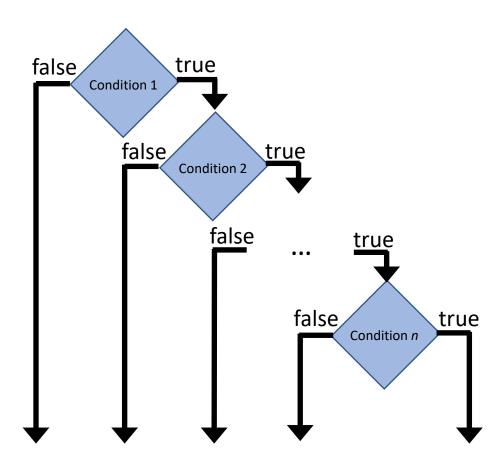

Counting Program Paths

How many paths are there for n nested branches?

```
if(condition_1){
  if(condition 2){
    if(condition_3){
      if(condition_n){
        // conditions 1 through n
         // must all be true to reach here
```

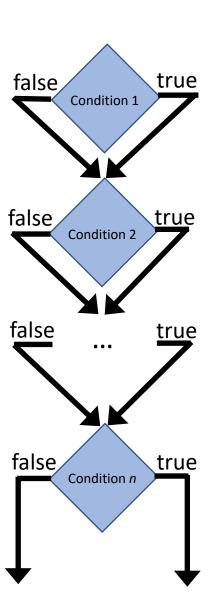

Counting Program Paths

• How many paths are there for n non-nested branches?

```
if(condition_1){
  // code block 1
if(condition 2){
  // code block 2
if(condition_3){
  // code block 3
if(condition_n){
  // code block n
```

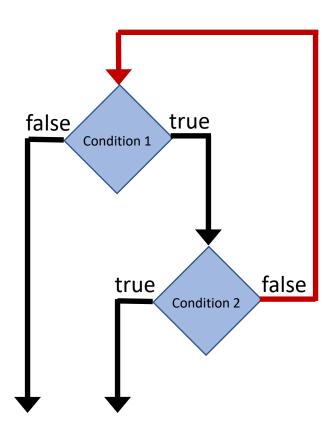

Considering Loops

- Programs may have loops
 - How many paths does this program have?
 - Can we say if this program halts?

```
while(condition_1){
   if(condition_2){
     break;
   }
}
```

The Halting Problem

Suppose, we could construct:

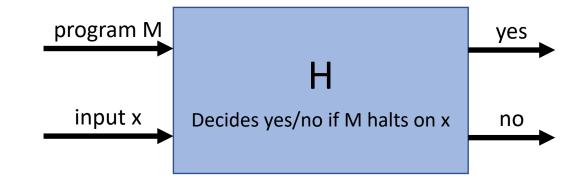

H(M, x) := if M halts on x then return true else return false

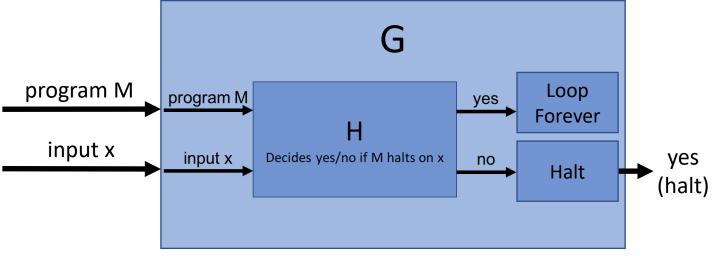

Then we could construct:

G(M, x) := if G(M, x) is false then return true else loop forever

But if we then pass *G* to itself, that is G(G,G), we get a contradiction between what *G* does and what *H* says that *G* does. If *H* says that *G* halts, then *G* does not halt. If *H* says that *G* does not halt, then it does halt.

H cannot exist.

Group Formation

• Count off 1 to 4

Eclipse Plugin Development + Atlas

- Debug As → Eclipse Application
- Atlas Shell (add plugin to dependencies)

Problem 2 (remaining class time)

- Discuss path counting strategy
 - Why do we need a DAG? What's the implications of using a DAG?
 - What is the complexity of the algorithm with respect to the DAG?
- Explore support code
 - CFGPrinter.java Example
